

A DURABLE PATHWAY FROM DATA COLLECTION TO PUBLIC USE

Transportation data should outlast the project that created it.

The Recurring Problem

Transportation data collected for one project rarely survives to serve the next one. Pedestrian networks, bicycle infrastructure, transit-facility access, and community conditions data arrive in different formats, carry uneven documentation, and are rarely updated after construction or field changes.

The result: agencies restart from scratch, reinvesting in collection, validation, and documentation every time a new project, grant application, or planning study requires accurate network data.

One Investment. Two Returns

TDEI provides durable transportation data infrastructure through shared standards, exchange services, and stewardship pathways that carry detailed transportation-network data through its full lifecycle.

Immediate project gains:

- ✓ Project-specific inventory
- ✓ Project-specific analysis
- ✓ Project-specific deliverables

Long-term organization gains:

- ✓ Standardized, documented data
- ✓ Quality records and version history
- ✓ A governed update pathway
- ✓ A reusable network record

In Practice

TDEI is designed for **state DOTs, MPOs, transit agencies, regional planning organizations, and local jurisdictions** that collect or use pedestrian, bicycle, transit-access, on-demand service, or multimodal network data.

Washington State DOT uses TDEI to document the complete pedestrian network, interaction with trails and bike network, and access to destinations across the entire state, creating a maintained network record that now supports federal reporting, local capital prioritization and growth management. What previously required a full Complete Streets re-collection effort at each project cycle now begins with a validated baseline.

Klickitat rural MPO integrated TDEI into their very first ADA transition plan process, returning project deliverables to the shared network rather than a project folder. The result: 2101 intersections with detailed documented network available for the next planning cycle at minimal collection cost, within agency capacity.

King County Metro uses TDEI to measure true pedestrian access conditions to 5000+ stops and stations, connecting field-verified data directly to service planning, Paratransit pathway reviews and ADA compliance workflows.

A Full Data Lifecycle

Transportation data should outlast the project that created it. TDEI provides the infrastructure for data to move through every stage- from first collection to long-term public use.

Each participating organization determines how this lifecycle fits its own authority, staffing, workflows, and priorities.

Flexible Maintenance and Update Pathways

Community Engagement

Who Uses TDEI Data

Bring one current project, dataset, or stewardship problem.

The TDEI team can help define the first use case, select an appropriate participation and maintenance pathway, and ensure that today's work becomes a reusable foundation for what comes next.
