

Transportation Data Exchange Initiative (TDEI)

About TDEI

The University of Washington's Transportation Data Exchange Initiative (TDEI) under USDOT's ITS4US Program is demonstrating how standardized data and collection methods can create practical, user-centered solutions for pedestrian travel. The program is built on a data sharing platform powered by robust data collection tools, including AI, crowdsourcing, and data providers, with built-in data verification and validation. TDEI leverages open data standards such as OpenSidewalks, General Transit Feed Specification (GTFS)-Flex, and GTFS-Pathways to enable demonstration trip planning and turn-by-turn navigation apps.

TDEI saved King County an estimated two years of data collection and analysis by using AI and machine learning to comprehensively perform sidewalk inventories. Built for scalability and replicability, UW has established institutional partnerships for data sharing with leading tech industry companies and transit agencies.

FIFA AccessMap Multimodal Event Edition

The FIFA AccessMap Multimodal Event Edition delivers an accessibility-first, multimodal trip planning experience integrated directly into the official FIFA local apps (SEA & WIN) for the Puget Sound region — with AccessMap appearing alongside Google Maps and Apple Maps as a first-class navigation option. This represents a genuine, high-visibility real-world deployment of the TDEI approach, not a standalone demonstration.

Key capabilities and TDEI value:

- Multimodal routing
- Micro-wayfinding via ScoutRoute-collected data
- Expanded data coverage for the Puget Sound region
- Interoperable, standardized data (GTFS, GTFS Pathways, pedestrian graph)
- Lasting data legacy

OS-CONNECT: Washington State's Living Pedestrian Infrastructure

Through Washington State Legislative Proviso (ESB 1124.111), the Taskar Center for Accessible Technology at UW produced a statewide, connected, routable pedestrian network covering areas where over 50% of Washingtonians live.

What was built:

- Statewide sidewalk inventory under open license and open data standards
- Connected, routable graph identifying over 4,000 accessibility islands and network gaps
- Tools for agencies to update, validate, and maintain the data over time

What continuity requires:

- Additional data covering areas
- Ongoing data refresh and update streams
- QA/QC and stewardship capacity
- Community engagement workflows that connect local input to planning action

Link: [OS-CONNECT](#)

Active uses today:

- ADA transition planning — City of Goldendale, Gorge Transit, King County Metro
- Safe Routes to School analysis across 103 schools in Seattle and Bellevue
- Emergency preparedness — identifying communities at risk of isolation during infrastructure failures
